

K40 P1SE LG/SAI

A b s t r a c t

5 The invention relates to an arrangement (1) for a
locking mechanism (2) for a binder (3), which comprises a
locking rail (5) that is detachably interconnectable with a
number of hooks (4), which rail is capable of displacement by
means of a manually actuated, spring-operated locking button
10 (6).

 In accordance with the invention, the locking
button (6) is executed in such a way that it performs both a
spring function and a guiding function for the axially (7-8)
15 mobile locking rail (5) and is detachably attachable to the
locking rail (5) at its one end.
